

Section 1

Introduction

1 Introduction

Information about the environment in the Porcupine Basin area of IOSEA2 (Figure 1.1) has been collated in order to characterise and assess the sensitivities of those features that might be affected by the proposed draft plan, or which may influence the impacts resulting from such operations.

The description focuses on the offshore IOSEA2 area itself and adjacent areas that could potentially interact with the proposed exploration activities, but also places the information within a regional context. In recognition of concerns about possible impacts on coastal environments, consideration is also given to coastal sensitivities including human use and conservation features.

Whilst drawing on relevant up-to-date scientific information, the description was intended to be easily understood by a wide audience. The information in this annex was originally intended to be a part of the environmental report. However, owing to the quantity of technical information available, a summary version was prepared for inclusion in the environmental report in order to improve readability of that document and to facilitate decision making.

The glossary and list of abbreviations are given in the main environmental report.
